No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

TITLE OF INVENTION: Nucleic Acid Molecules and Other Molecules Associated With
TITLE OF INVENTION: Plants
TITLE OF INVENTION: Plants
FILE REFERENCE: 38-21(5322)B
CURRENT APPLICATION NUMBER: US/10/425,115
CURRENT FILING DATE: 2003-04-28
NUMBER OF SEQ ID NOS: 369326
SEQ ID NO 158496
LENGTH: 1601
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 12

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 6, A

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description

Sequence 1, Application US/10289762
Publication No. US20040006218A1
GENERAL INFORMATION:
APPLICANT: Griffals, R.
TITLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragments
TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, preve
TITLE OF INVENTION: and treatment of infection
FILE REFERENCE: 9710-003-999
CURRENT APPLICATION NUMBER: US/10/289,762
CURRENT FILING DATE: 2003-03-27
NUMBER OF SEQ ID NOS: 6849

| TITLE OF INVENTION: Plants and Uses Thereof for Plant Improvement
TITLE OF INVENTION: CDNA SEQUENCES AND USES FOR PLANT IMPROVEMENT FILE REFERENCE: 38-10(52726)C
CURRENT APPLICATION NUMBER: US/10/219,999
CURRENT FILING DATE: 020-08-15
PRIOR APPLICATION NUMBER: US 60/324,109
PRIOR FILING DATE: 2001-09-21
PRIOR FILING DATE: 2001-08-15
NUMBER OF SEQ ID NOS: 63520
SEQ ID NO 18302
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Control plasmid, useful as internal standard in amplification method for detecting Mycoplasma, contains primers that recognize parts of the Mycoplasma 16S rRNA gene.

Claim 2; Page 15; 25pp; German.

The invention relates to a control plasmid (A) containing: (a) primers that recognize a segment of the 16S rRNA-encoding gene in the Mycoplasma genome, and (b) between the primers an amplicon that includes the sequence (i). (A) is used as a control in a PCR method for detecting Mycoplasma in biological materials, e.g. for diagnosing infections or control for PCR detection of cell cultures. (A) provides an internal method is more sensitive and specific than known processes, providing real-time PCR, has a broad dynamic and linear measurement range, allowing accurate quantitation. The present sequence is that of a Mycoplasma 16S rRNA gene PCR primer of the invention

```
The present invention describes a method for identifying a microorganism by comparing a composite sequence (I) of a ribosomal RNA gene region with TRNA wegion sequences of unknown microorganisms in a database and identifying the region in the database that matches with (I). (I) is generated by simultaneously obtaining nucleotide base sequence data from very copy of the rRNA gene region in the genome of the unknown microorganism by generating (I) and entering it into a first data register of a programmable computer, comparing the first data register is with reference data registers that encode a unique composite rRNA sequence corresponding to (I) and correlated with unique microorganism sequence corresponding to (I) and correlated with unique microorganism species name, and displaying the unique microorganism name correlated with the best matching first data register. The method is useful for identifying microorganisms which are useful in a variety of fields including human medicine, veterinary medicine, agriculture, food science and industrial microbiology. The microorganisms found in patients of Microorganism identification is also useful for monitoring food safety by microorganism is also useful for monitoring food affety by microorganisms whence an also be identified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bacterial; 16S rRNA; identification; polymorphism; microorganism; classification; primer; human medicine; veterinary medicine; agriculture; food science; industrial microbiology; infectious disease; food safety;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              testing for pathogens. Plants harbouring phytopathogenic bacteria are also identified. The method is convenient and efficient as there is no need to isolate one or more individual 16S rRNA genes. AAA39023 to AAA39039 represent primers for the 16S rRNA gene, which are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying an unknown microorganism by generating a composite sequence of its ribosomal RNA gene region and comparing with composite ribosomal RNA region sequences of distinct microorganisms in a database.
                                                                                 .

This invention describes a novel device for detecting analytes in a sample. The device comprises a carrier surface which contains at least cone analytical region (including at least one immobilised binding partner for the analyte) and at least one immobilised binding partner for the analyte) and at least one immobilised binding partner for the analyte) and at least one sometimes of the amplification and detection of (i) bacterial species associated with pardontitis, (ii) gene expression patterns and (iii) single-nucleotide polymorphisms (SNP'S). The device provides reproducible, rapid and simple colymorphisms (SNP'S). The device provides reproducible, rapid and simple pardontities for the control step is required and system costs are not exactly the same series of operations as the analytical regions, so no extra time for the control step is required and system costs are not stored for archaving, the control results are also saved. Many different analytes can be detected simultaneously and controls for many different anelytes can be detected simultaneously and controls for many different anelytes can be detected simultaneously and controls for many different anoligonucleotide associated with the detection of 165 rRNA from various in the control is used to illustrate the device of the

Nucleic acid probes - specific for RNA of Eubacteria, for use in clinical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Probes allow assay for Eubacteria to be carried out in clinical samples such as blood or urine, in a cost effective and fast manner. The probes require only small sample sizes which may be amplified, with some of the probes suitable as primers. (Updated on 09-JAN-2003 to add missing OS field.) (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detection, microorganism, 16S rDNA, 16S rRNA, identification, gene, microbial encephalitis, viral encephalitis, ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel device for detecting analytes in a sample. The device comprises a carrier surface which contains at least one analytical region (including at least one immobilised binding partner for the analyte) and at least one control region which controls of the quality of analyte) and the device is particularly used for nucleic acid amplification and detection of (i) bacterial species associated with parodontitis, (ii) gene expression patterns and (iii) single-nucleotide polymorphisms (SNP's). The device provides reproducible, rapid and simple analysis of nucleic acid sequences. The control system is subjected to exactly the same series of operations as the analytical regions, so no extra time for the control step is required and system costs are not significantly more than for analysis without a control. If the device is stored for archiving, the control results are also saved. Many different analytes can be detected simultaneously and controls for many different analytes an oligomucleotide associated with the detection of 165 rRNA from various bacterial samples, which is used to illustrate the device of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Device for determining analytes, useful e.g. for detecting bacteria that cause parodontitis, comprises a surface with immobilized analytical and control agents.
                                                                                                                                                                                                                                                                        Probe; detection; primer; 16S rRNA; amplification; parodontitis; SNP; gene expression pattern; single-nucleotide polymorphism; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                            16S rRNA detection associated positive control oligonucleotide #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

The present invention describes a method for determining the total microbial content in a sample, comprising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microorganisms. Also describes is an isolated polynucleotide (I) or its complement having a nucleotide sequence which is comprised by 16S rDNA or 16S rENA, substantially conserved amongst two or more species of microorganism. (I) can be used (I) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism by its genus or prevalence of a particular genus or species of microorganism; in a sample; and (3) as a probe of identify microorganism at the genus or species level, and as a trap for total microbial daraget material; in assessing encephalitis and distinguishing between microbial and viral encephalitis. (I) is applicable to a range of industries including the medical, agricultural and industrial industries with specific uses including enviroprotection, bioremediation, medical diagnosis, water quality control or food quality control. (I) provides an ability to detect bacteria from samples which industries indicated by viable culture count methods and enables rapid differentiation of bacteria from viral infections within the rapid of the provides and that would in all practicality remain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                limited time constraints sometimes experienced in life-threatening clinical situations. ABLS9702 to ABLS9821 represent 168 rDNA fragments, and ABLS9822 to ABLS9830 represent primers and probes, used in the exemplification of the present invention
                                                           Polynucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 168 rDNA or 168 rRNA, substantially conserved amongst two or more species of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detection, microorganism, 16S rDNA, 16S rRNA, identification, gene, microbial encephalitis, viral encephalitis, ds.

microbial content in a sample, comparising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microbial content in a sample, comparising amplifying a target nucleotide sequence which is comprised by 16S rDNA or nor complement having a nuclectide sequence which is comprised by 16S rDNA or 16S rRNA, substantially conserved amongst two or more species of microorganism. (1) can be used: (1) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identify may particular microorganism or species level, and as a trap for identify microorganisms at the genus or species level, and as a trap for identify microorganisms at the genus or species level, and as a trap for identify microorganism and viral encephalitis. (1) is applicable to a range of industries including the medical, agricultural and user sense in microbial and viral encephalitis. (1) is applicable to a range of industries including enviroprotection, broamediation, medical diagnosis, water quality control or food quality control. (1) provides an ability to detect bacteria from samples which undetected or under-estimated by viable culture count methods and enables rapid differentiation of bacteria from viral infections within the rapid differentiations. Ablisy02 to Ablisy821 represent les robne, used in the constraint of the constraints sometimes experienced in life-threatening constraints sometimes experienced in life-threatening constraints of the propes. used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                           Polymucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rNNA, substantially conserved amongst two or more species of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detection, microorganism, 16S rDNA, 16S rRNA, identification, gene, microbial encephalitis, viral encephalitis, ds.

The present invention describes a method for determining the total microbial content in a sample, comprising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microorganisms. Also describes is an isolated polynucleotide (1) or its complement having a nucleotide sequence which is comprised by 168 rDNA or 168 rRNA, substantially conserved amongst two or more species of microorganism. (1) can be used: (1) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identifying a particular microorganism or prevalence of a particular genus or species of microorganism at the genus or species level, and as a trap for cortify microbial-derived target material; in assessing encephalitis and distinguishing between microbial and viral encephalitis. (1) is applicable to a range of industries including the medical, agricultural distinguishing between microbial and viral encephalitis. (1) is applicable to a range of industries including the medical, agricultural addistinguishing between microbial and viral encephalitis. (1) is applicable to a range of industries including the medical, agricultural control. (1) provides an ability to detect bacteria from samples which includent constraints sometimes experienced in life-threatening rapid differentiation of bacteria from viral infections within the limited time constraints sometimes experienced in life-threatening and ABL59822 to ABL59820 to ABL59821 represent 16S rDNA fragments, and ABL59822 to ABL59821 represent invention
                                                          Polynucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rRNA, substantially conserved amongst two or more species of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detection; microorganism; 16S rDNA; 16S rRNA; identification; gene; microbial encephalitis; viral encephalitis; ds.

The present introduction describes a meriou for determining the cotain content in a sample, comprising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microbraganisms. Also describes is an isolated polynucleotide (I) or its complement having a nucleotide sequence which is comprised by 168 rDNA or 168 rENA, substantially conserved amongst two or more species of microbraganism. (I) can be used: (I) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for dentifying a microbraganism, in a sample; (I) as a primer or probe for contentifying a microbraganism, in a sample. (I) can also be used to identifying a particular microorganism or species level, and as a trap for total microbial-derived target material; in assessing encephalitis and distinguishing between microbial and viral encephalitis. (I) is applicable to a range of industries including the medical, agricultural and industries with specific uses including enviroprotection, bioremediation, medical diagnosis, water quality control or food quality control. (I) provides an ability to detect bacteria from samples which are difficult to cultivate and that would in all practicality remain cundetected or under-estimate and that would in all practicality remain cundetected or under-estimate and that would in all practicality remain cultimical situations. ABLS9702 to ABLS921 represent 165 rDNA fragments, and ABLS9822 to ABLS9810 represent primers and probes, used in the
                                                        Polynuclectide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rRNA, substantially conserved amongst two or more species of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

microbial content in describes a menical to versiminary die occidentation describes is an isolated amongst 2 or more species of microorganisms. Also describes is an isolated polynucleotide (1) or its complement having a nucleotide sequence which is comprised by 16S rDNA or isolated polynucleotide (1) or its complement having a nucleotide sequence which is comprised by 16S rDNA or isolated polynucleotide (1) or its complement having a nucleotide sequence which is comprised by 16S rDNA or microorganism. (1) can be used: (1) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism by its genus in a sample; and (3) as a probe for identifying a microorganism by its genus or prevalence of a particular genus or species level, and as a trap for identify microbial-derived target material; in assessing encephalitis and istinguishing between microbial and viral encephalitis. (1) is applicable to a range of industries including enviroprotection, bloremediation, medical diagnosis, water quality control or food quality control. (1) provides an ability to detect bacteria from samples which bloremediation, medical diagnosis, water quality control or food quality control. (1) provides an ability to detect bacteria from samples which indetected or under-estimated by viable culture count methods and enables capital situations. ABLS9902 to ABLS981 represent les robn fragments, used in the available of the constraints sometimes experienced in life-threatening constraints.
                                                           Polynucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rRNA, substantially conserved amongst two or more species of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detection; microorganism; 16S rDNA; 16S rRNA; identification; gene; microbial encephalitis; viral encephalitis; de
                                                                                                                                                                                                                 The present invention describes a method for determining the total

the present invariances a mercina into determining the Cotal accordent in a sample, comprising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microorganisms. Also describes is an isolated polynucleotide (1) or its complement having a nucleotide sequence which is comprised by 16s rDNA or 16s FRNA, substantially conserved amongst two or more species of microorganism. (1) can be used: (1) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for identifying a microorganism by its genus in a sample; and (3) as a primer or probe for identifying a microorganism by its genus in a sample; and (3) as a primer or probe for controlitying a microorganism by its genus in a sample; and (3) as a primer or probe for identifying a microorganism, in a sample; (1) can also be used to identify microbial-derived target material; in assessing encephalitis and distinguishing between microbial and viral encephalitis. (1) is and industrial industries including the medical, agricultural and industrial industries with specific uses including enviroprotection, controlition, medical diagnosis, water quality control or food quality control. (1) provides an ability to detect bacteria from samples which are difficult to cultivate and that would in all practicality remain undetected or under-estimated by viable culture count methods and enables control situations. ABLS9902 to ABLS9821 represent les rons within the constraints sometimes experienced in life-threatening constraints sometimes experienced in life-threatening constraints constraints and propes, used in the
                                                         Polynucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rNNA, substantially conserved amongst two or more species of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detection, microorganism, 16S rDNA, 16S rRNA, identification, gene, microbial encephalitis, viral encephalitis, ds.
                                                                                                                                                                                                                 present invention describes a method for determining the total

The present invention describes a method for determining the total microbial content in a sample, comprising amplifying a target nucleotide sequence which is substantially conserved amongst. 2 or more species of microorganisms. Also describes is an isolated polynucleotide (I) or its complement having a nucleotide sequence which is comprised by 16S rDNA or 16S FRAM, substantially conserved amongst two or more species of microorganism. (I) can be used: (I) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for identifying a microorganism by its genus in a sample, and (3) as a probe for identifying a particular microorganism or prevalence of a particular genus or species of microorganism or prevalence of a particular genus or species of microorganism or the genus or species level, and as a trap for total microbial-derived target material; in assessing encephalitis and distinguishing between microbial and viral encephalitis. (I) is applicable to a range of industries including the medical, (I) is applicable to a range of industries including the medical, on as a trap for control. (I) provides an ability to detect bacteria from samples which secific uses including enviroprotection, bioremediation, medical diagnosis, water quality control or food quality control. (I) provides an ability to detect bacteria from samples which englid differentiation of bacteria from viral infections within the undetected or under-estimated by viable culture count methods and enables rapid differentiation of bacteria from viral infections within the culture count methods and enables reported in the count methods and enables or particular count methods and enables or partic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   limited time constraints sometimes experienced in life-threatening clinical situations. ABLS9702 to ABLS9821 represent 16S rDNA fragments, and ABLS9822 to ABLS9830 represent primers and probes, used in the exemplification of the present invention
                                                                     Polymucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rRNA, substantially conserved amongst two or more species of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detection; microorganism; 16S rDNA; 16S rRNA; identification; gene; microbial encephalitis; viral encephalitis; ds.

The present invention describes a method for determining the obtainment of the present invention describes a method for described amongst 2 or more species of sequence which is substantially conserved amongst 2 or more species of microcyanisms. Also describes is an isolated polynucleotide (1) or its complement having a nucleotide sequence which is comprised by 165 rDNA or 165 rRNA, substantially conserved amongst two or more species of incroorganism. (1) can be used: (1) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for dentifying a microorganism by its genus in a sample; and (3) as a probe for identifying a particular microorganism or prevalence of a particular of genus or species of microorganism; in a sample; and (3) as a probe for identify microorganisms at the genus or species level, and as a trap for otal microbial-derived target material; in assessing encephalitis and distinguishing between microbial and viral encephalitis. (1) is control. (1) provides an ability to detect bacteria from samples which control. (1) provides an ability to detect bacteria from samples which control. (1) provides an ability to detect bacteria from samples which control timeted time constraints sometimes experienced in life-threatening control. Or food quality control or indetected or undetected by viable culture count methods and enables rapid differentiation of bacteria from viral infections within the control or sublications ABLS9822 to A
                                                             Polynucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rRNA, substantially conserved amongst two or more species of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection, microorganism, 16S rDNA, 16S rRNA, identification, gene, microbial encephalitis, viral encephalitis, ds.
                                                                                                                                                                                                                                    The present invention describes a method for determining the total

The present in a sample, comparising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microbial content in a sample, conserved amongst 2 or more species of microorganisms. Also describes is an isolated polynucleotide (I) or its complement having a nucleotide sequence which is comprised by 16S rDNA or 16S rRNA, substantially conserved amongst two or more species of microorganism. (I) can be used: (1) as a primer or probe for determining the total microbial content in a sample; (2) as a primer or probe for determining the total microorganism by its genus in a sample; and (3) as a primer or probe for dentifying a particular microorganism or prevalence of a particular genus or species level, and as a trap for identify microorganisms at the genus or species level, and as a trap for total microbial-derived target material; in assessing encephalitis and distinguishing between microbial and viral encephalitis. (I) is applicable to a range of industries including the medical, agricultural and industrial industries with specific uses including enviroprotection, bloremediation, medical diagnosis, water quality control or food quality control. (I) provides an ability to detect bacteria from samples which undetected or under-estimated by viable culture count methods and enables immited time constraints sometimes experienced in life-threatening climited situations. ABL59902 to ABL59821 represent les rbnA fragments, as a primer of the experience of in the comparation of the present incomparion or propersent primers and probes, used in the Polynucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rRNA, substantially conserved amongst two or more species of present invention describes a method for determining the total Example 12; Fig 1C; 101pp; English.

Martin FE, Nadkarni MA; Hunter N, Jacques NA,

Polynucleotide useful as primer or probe for determining microbial content in sample, has sequence which is comprised by 16S rDNA or 16S rNNA, substantially conserved amongst two or more species of nicroorganism.

Example 12; Fig 1C; 101pp; English.

microbial content in a sample, comprising amplifying a target nucleotide sequence which is substantially conserved amongst 2 or more species of microorganisms. Also describes is an isolated polynucleotide (I) or its complement having a nucleotide sequence which is comprised by 165 rDNA or 165 rRNA, substantially conserved amongst two or more species of microorganism. (I) can be used: (I) as a primer or probe for determining the total microbial content in a sample, (2) as a primer or probe for dentifying a microorganism by its genus in a sample, and (3) as a probe for identifying a microorganism, in a sample, (I) can also be used to identify microorganism at the genus or species level, and as a trap for total microbial-derived target material; in assessing encephalitis and distinguishing between microbial and viral encephalitis. (I) is and industrial industries including the medical, agricultural and industrial industries with specific uses including enviroprotection, bloremediation, medical disagnosis, water quality control or food quality control. (I) provides an ability to detect bacteria from samples which are difficult to cultivate and that would in all practicality remain entity of the same and enables and enables and enables time constraints sometimes experienced in life-threatening l situations. ABL59702 to ABL59821 represent 16S rDNA fragments, 9822 to ABL59830 represent primers and probes, used in the invention describes a method for determining the total rapid differentiation of bacteria from viral infections within the exemplification of the present invention The present clinical imited
